<b>Target version:</b>			
<b>Resolution:</b>			
<b>Description</b>			
Migrated from the Kowari RFE List			
A Resolver that wraps the store and can read a basic inferencing ruleset and insert/delete multiple statements in/from the store in response to each statement passed to modify.			
This should include a <a href="#">ContentHandler</a> that can parse it's config file into rdf so the rules can be stored in a ?def model in the system-store. It would be important to be able to include by reference an external config-file (accessed via the <a href="#">ContentHandler</a> ).
