Target version:			
Resolution:			
Description			
Migrated from the Kowari RFE List			
A Resolver that wraps the store and can read a basic inferencing ruleset and insert/delete multiple statements in/from the store in response to each statement passed to modify.			
This should include a ContentHandler that can parse it's config file into rdf so the rules can be stored in a ?def model in the system-store. It would be important to be able to include by reference an external config-file (accessed via the ContentHandler).
